

CONVENCIÓN SOBRE EL COMERCIO INTERNACIONAL DE ESPECIES  
AMENAZADAS DE FAUNA Y FLORA SILVESTRES

Vigésimo séptima reunión del Comité de Fauna  
Veracruz (México), 28 de abril – 3 de mayo de 2014

Interpretación y aplicación de la Convención

Examen del comercio significativo de especímenes de especies del Apéndice II  
[Resolución Conf. 12.8 (Rev. CoP13)]

SELECCIÓN DE ESPECIES PARA PROCEDER AL EXAMEN  
DE SU COMERCIO DESPUÉS DE LA COP16

1. Este documento ha sido preparado por la Secretaría.
2. En la Resolución Conf. 12.8 (Rev. CoP13), sobre el *Examen del comercio significativo de especímenes de especies del Apéndice II*, se:

*ENCARGA a los Comités de Fauna y de Flora, en colaboración con la Secretaría y los especialistas competentes, y en consulta con los Estados del área de distribución, que revisen la información biológica, comercial y de otro tipo sobre las especies del Apéndice II sujetas a niveles significativos de comercio, a fin de determinar los problemas y proponer soluciones respecto de la aplicación de los párrafos 2 a), 3 y 6 a) del Artículo IV...*

3. De conformidad con lo enunciado en el párrafo a) de esa resolución, bajo la sección *En lo que respecta a la realización del examen del comercio significativo*, la Secretaría solicitó al PNUMA-CMCM que preparase un resumen de la base de datos CITES sobre las estadísticas de los informes anuales mostrando el nivel neto registrado de las exportaciones de especies del Apéndice II durante los últimos cinco años. Su informe se adjunta como Anexo 1 al presente documento (únicamente en inglés). Los datos primarios utilizados para preparar este resumen figuran en el documento AC27 Inf. 2.
4. En el párrafo b) de la misma sección se encarga al Comité de Fauna, a tenor de los niveles de comercio registrados y la información de que disponen el Comité, la Secretaría, las Partes u otros especialistas pertinentes, que seleccione las especies objeto de mayor preocupación para que sean examinadas (independientemente de que esas especies hubiesen sido objeto de examen previo).
5. Con el fin de ayudar al Comité en esta selección, el PNUMA-CMCM ha desarrollado un proceso, basado en un amplio análisis del comercio, para identificar las especies que se deben examinar. Este proceso se describe en el Anexo 2 al presente documento (únicamente en inglés), que contiene también un resumen del análisis ampliado del comercio y una lista de las posibles especies así identificadas.

Recomendación

6. Se invita al Comité a seleccionar especies objeto de mayor preocupación para los exámenes de su comercio.

## Recorded Net Exports of Appendix-II Fauna 2007-2011

To comply with the specifications of Resolution Conf. 12.8 (Rev. CoP13), an initial data output was produced comprising net exports of Appendix-II species over the most recent five-year period for which near-complete data are available (2007-2011). Data from 2012 were excluded because at the time of the data extraction (2 December 2013), only 40% of annual reports had been received (72 out of the 180 Parties to CITES); however, 2012 data can be viewed within the dataset provided in AC27 Inf. 2. This output only contains direct trade reported as wild-collected ('W'), ranched ('R'), unknown ('U') or without a source reported. A full list of "terms" (i.e. descriptions of specimens in trade) traded is available in the CITES Trade Database interpretation guide, see: [www.unep-wcmc-apps.org/citestrade/docs/EN-CITES\\_Trade\\_Database\\_Guide.pdf](http://www.unep-wcmc-apps.org/citestrade/docs/EN-CITES_Trade_Database_Guide.pdf). Specimens traded at levels averaging less than one item over the five-year period have been excluded from the output. Quantities recorded have been rounded to the nearest decimal place, when applicable.

\*Species subject to taxonomic change at CoP16 in 2012.

### Selection of species for inclusion in the Review of Significant Trade following CoP16 Extended analysis

UNEP-WCMC has undertaken an extended analysis of the Appendix-II trade data with the aim of assisting the CITES Animals Committee with the task of species selection for the Review of Significant Trade. Species that may merit further consideration by the Parties on the basis of this analysis (methodology detailed below) are provided in Table 1.

#### **Methodology**

##### **Data used**

This extended analysis of gross exports in Appendix-II animal species covers trade data over the most recent ten-year period for which near-complete data is available (2002-2011). A longer period was deemed more appropriate to enable the identification of slopes and dispersion of trade levels, used for the analysis. As with the initial data output produced (see Annex 1 of the present document), specimens traded at levels averaging less than one over the most recent five-year period were excluded. Similarly, only trade data where the reported source was wild-collected, ranched, unknown or where there was no reported source were included. Trade at the genus level is included. However, trade reported at higher taxonomic levels (e.g. at the family, order or class level) has been excluded. The number of individual trade records involved in this analysis totalled over 1.9 million records.

As re-export data were not deemed to add relevant information to the analysis of the number of specimens taken for trade, only the data concerning direct exports was used in the analysis.

Since less than half of annual reports for 2012 had been received by UNEP-WCMC and included in the CITES Trade Database by the time of the data extraction (2 December 2013), data for 2012 were excluded from the extended analysis when temporal trends were analysed (e.g. sharp increase or gradual increases over time) and have not been provided in Table 1. However, data for 2012 were analysed separately to determine if the trade reported to date meets the high volume thresholds. This process is described in more detail under "Criterion 5".

The resulting dataset was subsequently filtered to include only the following terms of trade (i.e. types of specimens in trade):

- baleen, bodies, bones, carapaces, carvings, cloth, eggs, egg (live), fins, gall and gall bladders, horns and horn pieces, ivory pieces, ivory carvings, live, meat, musk (including derivatives for *Moschus moschiferus*), plates, raw corals, scales, shells, skin pieces, skins, skeletons, skulls, teeth, trophies, and tusks.

A full list of terms used is available in the CITES Trade Database interpretation guide<sup>1</sup>.

Conversion factors were applied to enable a more meaningful analysis of the different units in which trade was originally reported. Units of trade were converted in order to standardize the data and facilitate the analysis as follows.

Converted from	Converted to
grams or milligrams	kilograms
millilitres	litres
centimetres	metres
cm <sup>2</sup> or ft <sup>2</sup>	m <sup>2</sup>
cm <sup>3</sup>	m <sup>3</sup>

Parties often report corals in either kilograms or number of pieces. According to the *Guidelines for the preparation and submission of CITES annual reports* (Notification No. 2011/019), the preferred unit of

<sup>1</sup> A guide to using the CITES Trade Database: [http://www.unep-wcmc-apps.org/citestrade/docs/EN-CITES\\_Trade\\_Database\\_Guide.pdf](http://www.unep-wcmc-apps.org/citestrade/docs/EN-CITES_Trade_Database_Guide.pdf)

measurement for live corals is number of pieces and the preferred unit of measure for raw corals ('COR') is kilograms (see Notification to the Parties 2011/019). Therefore, in order to make meaningful comparisons, prior to the creation of the gross export tables, live coral reported in kilograms was converted to pieces and raw corals reported in pieces were converted to kilograms. Conversion factors published in Green and Shirley (1999) were used to convert between trade reported in kg to an equivalent in pieces and vice versa – see below:

Term	Converted to	Conversion factor
live corals (kg)	live corals (pieces)	206.1 ± 13.1g
raw corals (pieces)	raw corals (kg)	580g ± 121g

### Species selection

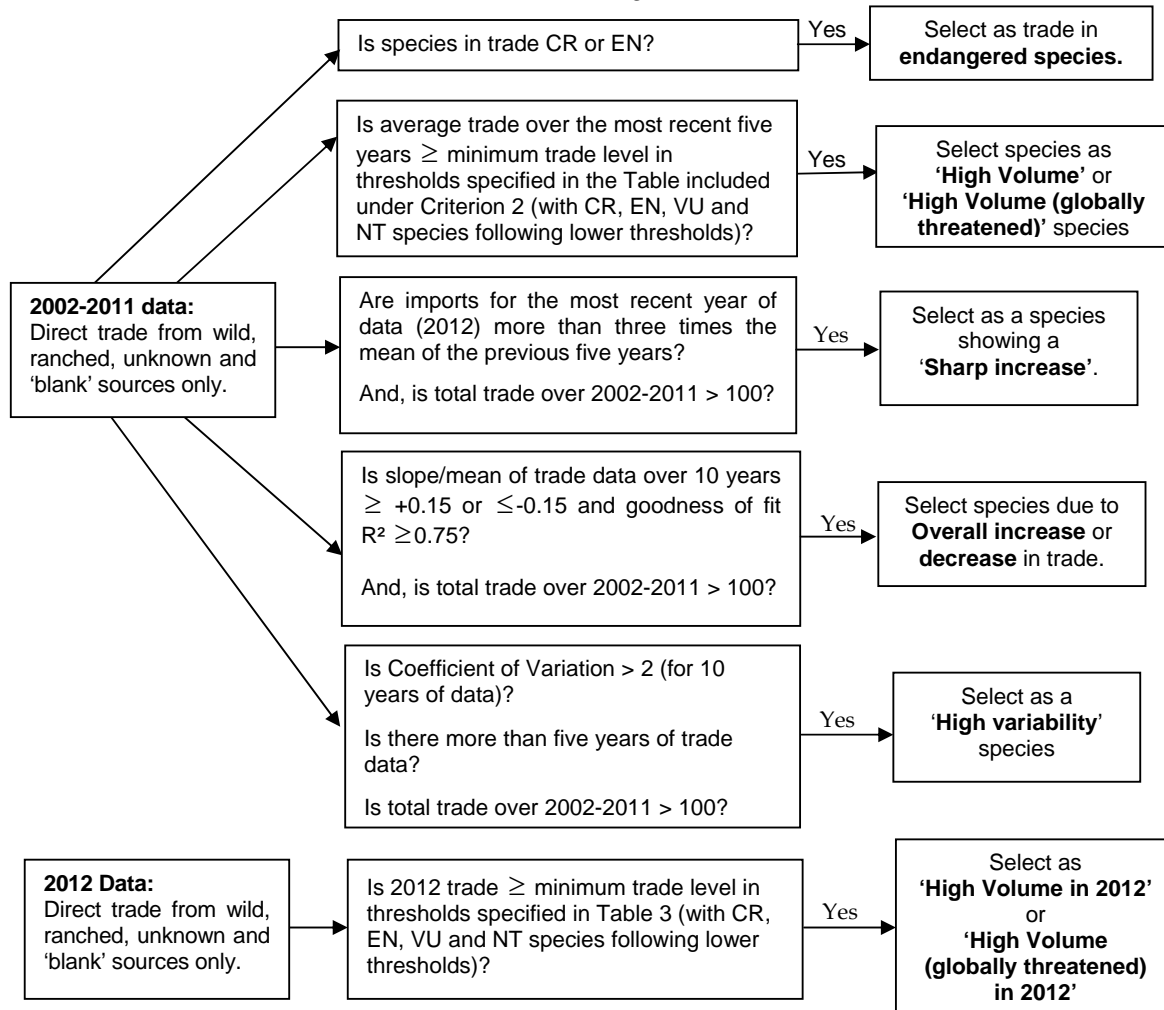

The resulting dataset was then filtered using a set of criteria to extract the species showing noteworthy patterns of trade. The selection of species highlighted in this detailed analysis was derived using the analysis protocol depicted in Figure 1. Trade levels were analysed and selected as noteworthy according to six criteria designed to identify:

- **Trade in endangered species:** Species categorized in the *IUCN Red List of Threatened Species* as Critically Endangered (CR) or Endangered (EN) were automatically selected for inclusion in Annex 1.
- **High volume and high volume (globally threatened):** trade exceeding a set of minimum thresholds over the most recent five year period with near-complete data (2007-2011). Globally threatened and near-threatened species were assessed on the basis of lower thresholds.
- **Sharp increase** in trade in 2011 in comparison to the average over preceding five-year period (2006-2010);
- **Overall increase/decrease:** General long-term increases or decreases in trade over a ten-year period (2002-2011);
- **High variability:** Long-term variability in trade between 2002 and 2011; and
- **High volume (2012):** Preliminary assessment of species traded at high volumes in 2012.

Further details on these criteria are summarized in Figure 1, followed by a detailed description of each criterion.

Species that met at least one of the criteria are included in Table 1 for further consideration by the Parties, along with the details of which criterion or criteria they met. To assist the CITES Animals Committee with the task of species selection for the Review of Significant Trade, UNEP-WCMC has provided additional information on species selected as part of this extended analysis in the Notes column. For instance, annotations are provided for species that were previously selected for review as part of the Review of Significant Trade following the 12th, 13th and 14th meetings of the Conference of the Parties, and for species that were newly listed on the CITES Appendices since 2002.

Figure 1: Flow chart for the selection of candidate species for consideration in the Review of Significant Trade

#### Criterion 1: Trade in endangered species

Species threatened with extinction are assumed to be more adversely affected by high trade volumes and more susceptible to changes in trade patterns than non-threatened species. For this reason, species in trade that have been classified as Critically Endangered and Endangered in the *IUCN Red List of Threatened Species*<sup>2</sup> were automatically selected for inclusion. The standard selection criteria have also been applied to these species – adjusted when other criteria are also met.

The global threat status was taken into consideration when applying the 'high volume' criterion (see Criterion 2).

It should be noted that not all species have been assessed in the *IUCN Red List of Threatened Species*. Therefore, the higher trade thresholds will apply to these species by default as it cannot be easily determined whether or not these species are threatened.

#### Criterion 2: High volume and High volume (globally threatened)

Species qualified for inclusion in Table 1 on the basis of 'high volume trade' or 'high volume (globally threatened)' if the average level of gross direct exports during 2007-2011 exceeded pre-determined thresholds (see below). Terms with the same unit (e.g. number) were combined in order to assess the high volume criterion. For instance, a species might meet the high volume criterion on the combination of trade in live, bodies and skins. As much of the trade in fish taxa and corals is recorded in kilograms (e.g. caviar and raw

<sup>2</sup> [www.iucnredlist.org](http://www.iucnredlist.org) Data downloaded on 12 December 2013.

corals), in addition to “number”, trade recorded in kilograms was also assessed for these taxa. Trade in units other than number, or kg in the case of fish and coral, (e.g. shipments, m and kg for all other taxa) were excluded from the high volume trade analysis, as it is difficult to combine these units meaningfully, but were included in the analyses for the remaining criteria.

Average minimum number of specimens from wild, ranched and unknown sources reported as directly exported per year over 2007-2011 needed to qualify for selection on the basis of high trade volume.

Types of animals	High volume	High volume (*globally threatened)
Mammals	500	50
Birds	500	50
Reptiles	2500	50
Amphibians	2500	50
Fish	2500 (number/kg)	50 (number/kg)
Invertebrates (non-corals)	2500	250
Corals	2500 (number/kg)	1000 (number/kg)

\*Applies to species that are classified as Critically Endangered (CR), Endangered (EN), Vulnerable (VU) or Near Threatened (NT) according to the IUCN Red List of Threatened Species.

Thresholds used to determine high volume trade were lower for globally threatened species than for non-threatened species. The minimum trade level required to meet the high volume criteria was also adjusted for all species categorised as Critically Endangered (‘CR’), Endangered (‘EN’), Vulnerable (‘VU’) or Near Threatened (‘NT’) in the *IUCN Red List of Threatened Species*.

For species not considered globally threatened, individual terms traded at levels less than 100 over the ten year period 2002-2011 were excluded from the table even if they contributed to the selection on the basis of high volume. Therefore, Table 1 only includes the most highly traded terms. For globally threatened species, all terms contributing to the high volume (globally threatened) selection criterion have been maintained within the table.

Criterion 3: Sharp increase in trade volume in 2011

Species met this criterion if the volume of direct exports during 2011 was more than three times the average trade volume of the preceding five years 2006-2010 (see graphic below). Species that, despite a sharp increase in trade in 2011, were still only traded in very low volumes (i.e. totalling less than 100 over the entire period), were not considered to meet this criterion.

Illustration of the application of the ‘sharp increase’ criterion (direct gross exports).

#### Criterion 4: Overall increase or decrease in trade levels 2002-2011

This criterion was included to take into account more general trends over the ten-year period 2002-2011 ('overall increase' and 'overall decrease'). General trends in trade for each taxon were identified by calculating the slopes of a best-fit linear function to the trade data, a large slope (positive or negative) indicating a notable change in trade levels over time (see graphic below).

Illustration of the application of the 'overall increase' criterion (direct gross exports).

For the purpose of comparison between taxa, the value of the slope was divided by the mean level of trade (for the ten-year period in question) for each taxon. Following examination of the slope/mean values for all species, a cut-off threshold of  $\pm 0.15$  was chosen. That is to say, values below  $+0.15$  and above  $-0.15$  were considered small slopes, while higher values than  $+0.15$  and lower than  $-0.15$  were considered large slopes. The goodness of fit of the trend-line was also considered with only species with  $R^2$  values of greater than 0.75 retained in the final selection for overall increase or decrease ( $R^2$  is a commonly-used criterion for goodness of fit with  $R^2=1.00$  being best fit).

Species that, despite an overall increase or decrease in trade over this period, were still only traded in very low volumes (i.e. totalling less than 100 over the entire period), were not selected on the basis of this criterion. The date of CITES listing was also taken into consideration for this criterion.

#### Criterion 5: Highly variable trade levels 2002-2011

Trade levels in some species can be highly variable, with relatively high volumes being traded in some years and little or no trade reported in other years. Most trade patterns do not fit the linear slope pattern, as described in the section on 'overall increase or decrease' above. Therefore, it was considered that a species showing high variation in levels of trade over the period of analysis might need more attention than those showing fairly constant trade levels. For the purpose of this analysis, a ten-year period (2002-2011) was examined. In the case of species added to the CITES Appendices within the period of analysis, only the years since its listing were analysed, provided that at least five years of trade data were available.

A number of measures of spread exist but the most appropriate when comparing across groups with different means was considered to be the coefficient of variation (CV). The CV is calculated as the standard deviation divided by the mean. This coefficient can therefore be used to make comparisons among taxa, as division of the standard deviation by the mean removes the effect of differences in scale of the trade volumes to which different taxa are subject.

Following examination of the coefficients of variation shown by all species within the period of analysis, a cut-off value of  $+2$  was used to select candidate taxa. Thus, taxa whose levels of trade showed a coefficient of variation higher than  $+2$  (i.e. highly variable trade levels) were considered as potential candidates for selection.

As with the previous criterion, species that were traded in low numbers (totalling less than 100 units during 2002-2011) were not selected for further consideration. In addition, species that had five or less data-points were excluded as zero-trade volumes are confounded with no-data due to lack of reporting, therefore many species would be selected as showing artificially high variability.

Criterion 6: Preliminary analysis of 2012 data to detect high volume trade

As 2012 data were incomplete at the time of analysis (January 2014), they could not be subjected to the same analysis as other years of data (as the incompleteness of the data would affect the criteria that detect increases/decreases over time). However, on the basis of the existing data, a preliminary analysis was conducted to detect high volume trade in 2012. The high volume criterion applied differed slightly from the criterion applied to the main dataset. Instead of comparing the average of five years of data with the thresholds mentioned above, the 2012 data was assessed on its own to determine if the thresholds had been exceeded on the basis of trade reported to date. Individual terms traded at levels in excess of the high volume threshold in 2012 are provided in the Notes column when this criterion was met.

**Table 1: Fauna taxa selected through the flowchart process** Quantities rounded to the nearest whole number, when applicable. Data extracted from the CITES Trade Database 2 December 2013.
