

## Implementation report format

The format below follows the structure of the *CITES Strategic Vision: 2008-2020* and aims to collect information to enable the Strategic Vision indicators to be implemented.

### **CITES vision statement**

Conserve biodiversity and contribute to its sustainable use by ensuring that no species of wild fauna or flora becomes or remains subject to unsustainable exploitation through international trade, thereby contributing to the significant reduction of the rate of biodiversity loss and making a significant contribution towards achieving the relevant Aichi Biodiversity Targets.

Article VIII, paragraph 7 (b), of the Convention requires each Party to submit to the CITES Secretariat a report on legislative, regulatory and administrative measures taken to enforce the provisions of the Convention.

The report format allows Parties to present information in a standard manner, so that it can be easily collated, with three main objectives:

- i) To enable monitoring of the implementation and effectiveness of the Convention;
- ii) To facilitate the identification of major achievements, significant developments, or trends, gaps or problems and possible solutions; and
- iii) Provide a basis for substantive and procedural decision-making by the Conference of the Parties and various subsidiary bodies.

Information on the nature and extent of CITES trade should be incorporated into the annual report [Article VIII paragraph 7 (a)], whereas the report provided under Article VIII paragraph 7 (b) should focus on measures taken to implement the Convention.

The report should cover the period indicated in [Resolution Conf. 11.17 \(Rev. CoP16\)](#) which urges that the report should be submitted to the Secretariat one year before each meeting of the Conference of the Parties (CoP). The reason for setting the report to be due a year in advance of the following CoP is to allow information to be collated so it can be considered by the Standing Committee in advance of CoP, and enable publication of the Strategic Vision indicators in advance of CoP.

Reports should be prepared in one of the three working languages of the Convention (English, French, Spanish).

Parties are *strongly* encouraged to prepare and submit their reports in electronic form. This will facilitate timely integration of information from Parties into publication of the Strategic Vision Indicators. If reports are only provided in hard copy, resources will be needed at the Secretariat to make an electronic copy, and this is not good use of Secretariat resources.

The completed report should be sent to:

Native species, which are protected by the Convention on International Trade in Endangered Species of Wild Fauna and Flora, and regulations of the European Union – included but not limited to – grey wolf, Eurasian lynx, birds of prey or orchids are fully protected by law, and commercial use of populations and specimens is prohibited.

There is a monitoring program in Hungary since 2002: the monitoring of rare and colonially-nesting birds. This program carried out by national park directorates is to estimate the populations of target species, to track their changes and also to reveal potential threats. 60 bird species are affected by the programme, including all strictly protected raptors, great bustard, black stork, common crane and Eurasian spoonbill. The results of these surveys give the base for international reporting obligation of Hungary. Beside this, national eagle census conducted by National park directorates & Birdlife Hungary (counting >250 volunteers and colleagues of the national parks) - covering 10% of the country, with the aim of monitoring wintering population of eagles and other raptors (harriers, kestrels, etc.). There are some specific studies about migration/movement of certain strictly protected species by satellite transmitters (Red-footed Falcon, Saker Falcon, Peregrine Falcon, Eastern Imperial Eagle, Great Bustard and Eurasian Spoonbill). In comparison with the 2013 national censuses the results show that most of the target species' population is stable however there are some declining trends, such as saker falcon and black kite.

Common Bird Monitoring Program is carried out by BirdLife Hungary. This program covers all common raptors in Hungary (i.e. common kestrel, common buzzard). However this project is suitable for trend analysis and determining presence/absence but it is not suitable for determining population size.

In the last few years the species' population is increasing in the country, especially in the east (Hortobágy region). Every autumn there is one or two regular goose monitoring census which cover this species too (main target is red-breasted goose). A few years ago more than 1000 individuals were observed in the country. The probable reasons why the species has become more abundant: 1. Shift of eastern migration route 2. Safer feeding areas.

The national waterfowl monitoring program includes this species too. It is carried out by national park directorates 8 month a year aiming to detect the

	<p>dynamics of breeding birds and migratory birds and carrying out synchronic censuses on Ramsar and other important migratory sites, monitoring of the effectiveness of nature conservation programs, monitoring nature conservation activities.</p> <p>The Hungarian Biodiversity Monitoring System (HBMS) is a national program governed by the State Secretariat for Environmental Issues and its mission is the long-term surveillance of the status and trends of biological diversity in Hungary.</p> <p>Today, the program has more than twenty years of experience on monitoring for conservation. This includes these seven plants and three large carnivore species as well.</p> <p><i>Lynx, lynx, Canis lupus, Ursus arctos, Cypripedium calceolus, Liparis loeselii, Himantoglossum jankae, Himantoglossum adriaticum, Ophrys insectifera, Ophrys sphegodes, Galanthus nivalis</i></p> <p><i>Vipera ursinii</i></p> <p>In order to stop the decline of Hungarian meadow viper <i>Vipera ursinii rakosiensis</i>, in 2004 MME BirdLife Hungary together with national parks and Budapest Zoo started a complex conservation programme, supported by the European Union LIFE Nature fund. The Hungarian Meadow Viper Conservation Centre was established with 16 adult individuals. The main goal of the Centre's operation is to breed vipers collected from threatened populations. In the semi natural outdoor enclosures vipers from different populations have a chance to breed, eliminating problems such as inbreeding arising from small isolated populations. At the moment 700 vipers live in the Centre and approximately at least 50 specimens are planned to be released annually.</p> <p>Along the Conservation Centre 'in situ' conservation is also present and monitoring of natural populations is important.</p> <p>link:  <a href="http://www.rakosivipera.hu/en/">http://www.rakosivipera.hu/en/</a>  <a href="http://www.rakosivipera.hu/en/monitoring/">http://www.rakosivipera.hu/en/monitoring/</a></p>

Indicator 3.4.1: The conservation status of species listed on the CITES Appendices has stabilized or improved.

3.4.1a	Do you have data which shows that the conservation status of naturally occurring species in your country listed on the CITES Appendices has stabilized or improved?

	All strictly protected raptors, great bustard, black stork, common crane, Eurasian spoonbill (see for the full list point.1,5,1a)			
	As we mentioned above there is a monitoring program in Hungary since 2002: the monitoring of rare and colonially-nesting birds. 60 bird species are affected by the programme, including all strictly protected raptors, eagle owl, great bustard, black stork, common crane and Eurasian spoonbill. In comparison with the 2013 national censuses the results show that most of the target species' population is stable however there are some declining trends, such as saker falcon and black kite. 	<i>Acipenser ruthenus</i>	The Sterlet ( <i>Acipenser ruthenus</i> ) is the most widespread potamodromous sturgeon that is indigenous in Danube and Tisza Rivers. The Hungarian populations decreased to a critic level which resulted in the status of 'non-catchable fish' (provided by law). Hungary carried out in situ and ex-situ measures to reach active conservation of these Sterlet populations. A genetic research was performed to avoid the decreasing of		

	<p>genetic variability in our Sterlet gene bank. The most varied genetic population was used for artificial reproduction. As a result 17.000 juvenile Sterlet (7000 kg in total) released into Duna and Tisza Rivers. (The individuals were 300-400 gram in weight and 40-50 cm in length.) 10% of the released fish was tagged in order to trace their growth and migration. The expected goal with this program (within 5-10 years) is to build up self-sustaining Sterlet populations, so the species can be catchable again. The project produced a conservation plan for Sterlet as well and its essence will shortly become a part of the related legislation.</p>
